Hi Drew,

The scripts get injected after DOMContentLoaded is already fired. You can just run them immediately. If you are also waiting for an element to appear, you can use a waitUntilLoaded function (ask ChatGPT to make it).

Also if you want to run a script on a specific page, GHL raises a custom event routeChangeEvent. I'd recommend running this console and seeing what it says.

```
window.addEventListener('routeChangeEvent', function(e) {
```

Thanks,

Tom Bristol

How can you fully manipulate the DOM once it's been loaded? We're trying to add some basic scripts to GHL, and can't figure out a way to trigger our functions once the DOM is fully loaded. The DOMContentLoaded event continues to return null. Thought I'd ask the pro.
